

## Intelligent power distribution panels

Configuration of sockets, inputs and management level is always carried out according to the customer's request.

These distribution panels are designed for installation into the skeleton of RDA cabinets.

By the type of management it is possible to measure and monitor basic electrical values, eventually temperature, humidity etc.

The superior versions of these distribution panels allow for example chaining through the serial interface and switching each socket. A standard option is a possibility of communication through the IP protocol, SNMP, web interface and possibility of the integration of monitoring system.
